Shared FASTQ stream

Acquire shared input lock parse and copy one chunk

Worker encodes one read and reverse complement

Choose seed start

Original redraw based on Dobin et al. 2013 doi:10.1093/bioinformatics/bts635

Search suffix array for maximal mappable prefix

Yes

Useful unsearched read segment?

No

Collect seed loci and orientations

Cluster nearby seeds into genomic windows

Stitch compatible seeds across matches, indels, and introns

Construct candidate transcript alignments

Score, filter, and rank candidates

Select primary and multimapping alignments

Emit alignment, junction, and optional count records
